Apni Awaaz · अपनी आवाज़

Your own voice, back.

Live demo: apni-awaaz-kappa.vercel.app · **Video:** [video link] · **Code:** github.com/nitya-prakash-pandey-2005/apni-awaaz · Built on Gnani AI

THE PROBLEM

Nearly half of the world's oral cancer is in India. GLOBOCAN 2024 estimates 2,05,878 new lip and oral cavity cancer cases in India, about 45.5% of the world's 4,52,205 (our calculation), and it is the most common cancer in Indian men (IARC India sheet, IARC world sheet). There are 35,169 new cases a year of cancer of the voice box, and about 12.9 lakh new strokes in a year (ThePrint, Lancet study). Many of these people lose their speech. What they get is an electrolarynx buzz, a notebook, or an app that speaks in a stranger's voice. Shrenik Shah wrote on paper for three months after his voice box was removed (Cancerworld).

THE PRODUCT

Apni Awaaz rebuilds a person's **own** voice from the WhatsApp voice notes they already have, then speaks for them in that voice:

- **My voice:** consent first, then a quality check on each note (speech length, clipping, noise, and a Prisma v3.0 transcript), then Gnani zero-shot voice cloning.
- **Speak:** type in any of 10 Indian languages, or romanised ("mujhe paani chahiye"), or tap a quick phrase. It is spoken through `vachana-vc-v1`, and a badge always says whose voice you heard.
- **Converse:** live captions of the other person (Prisma v3.0 streaming) and three suggested replies; one tap speaks a reply in your voice.
- **Banked messages, switch scanning and dwell selection** for stroke and ALS users, **word prediction** that saves keystrokes, and **SOS** that still speaks when the server is down and shares your location with family.
- **Where does it hurt?** Tap the body, pick how bad: one grammatical sentence, spoken in your voice.
- **Visit notes:** after a doctor's visit, the medicines, doses, tests and warning signs (each checked against what was actually said) are read back in your own voice and can be sent to family.

PROOF (LIVE GNANI RUNS, SYNTHETIC VOICES)

- The voice was built in 0.67 s. Sentences were spoken in the cloned voice in 1.5–2.2 s. Tamil was spoken in the cloned voice of a Hindi speaker.
- All 7 cloned clips were transcribed back by Prisma word for word, in Hindi and Tamil.
- Two simultaneous Speak presses were both spoken in the cloned voice, with no rate-limit error.
- Delete my voice removed the embedding, the consent record and every cloned clip.
- Visit notes from a live doctor visit kept the medicine and its dose exactly as spoken; the read-back in the cloned voice was transcribed back by Prisma in full.
- 244 Python and 12 JavaScript tests pass; CI is green on GitHub. Details: docs/test-log.md.

HOW IT IS DIFFERENT

Cloning a voice from old WhatsApp notes is **not new**: ElevenLabs' free Impact Program already does it, in 14 Indian languages, for people who apply (MIT Technology Review). Apple Personal Voice needs a fresh recording made while you can still speak, and supports no Indian language (Apple). Avaz and Jellow are Indian AAC apps, but they do not clone your voice. To our knowledge, no free, India-first phone app combines all three: your own voice from notes you already have, 10 Indian languages with code-mix, and a conversation mode with captions and suggested replies.

HONESTY NOTE

Every voice in our demos is synthetic (Gnani Timbre). We never cloned a real person. The live demo replays a real recorded session and has no backend. Consent is enforced by the API, and deletion is real.
